

DISCOVER A SOURCE OF EOSINOPHILIC ESOPHAGITIS (EoE)

LOOK BEYOND EOSINOPHILS TO TYPE 2 INFLAMMATION

DISCOVER > RECOGNIZE > RETHINK

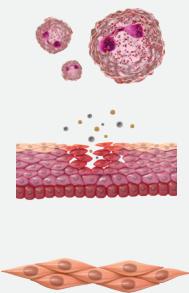

EoE AND THE ROLE OF TYPE 2 INFLAMMATION IN ITS PATHOGENESIS

Consider the overall disease burden when evaluating EoE

Eosinophilic esophagitis is driven primarily by IL-4, IL-13, and IL-5, which are key cytokines of Type 2 inflammation^{1,2}

IL-4 and IL-13 have a central impact on the complex pathophysiology of Type 2 inflammation in eosinophilic esophagitis

Understand the impact of Type 2 inflammation on symptoms of EoE²⁻⁴

Eosinophil trafficking

Epithelial barrier dysfunction

Remodeling and fibrosis, leading to strictures, rings, furrows, edema, exudates, and smooth muscle contraction

Symptoms

Treatment goals in eosinophilic esophagitis include^{5,6}:

Clinical remission

Lack or reduction of EoE-attributed symptoms

Endoscopic remission

Absence of inflammatory signs (eg, white exudates, furrows, edema), EREFS score ≤ 2

Histological inflammatory remission

Peak eosinophil count ≤ 6 EOS/HPF histology/HE stain

When evaluating patients with eosinophilic esophagitis, consider the impact of Type 2 inflammation

EOS, eosinophil; EREFS, endoscopic reference score; HE, hematoxylin and eosin; HPF, high-power field; ILC2, type 2 innate lymphoid cells.
